Lessons from the Latest Drought
CWA Spring Conference
May 18, 2017

Ellen Hanak, Center Director and Senior Fellow
What did we learn from the past drought that could help us better manage the next one?

- This drought gave us a glimpse into the future:
  - Record high temperatures made management difficult
  - The drought ended with an extremely wet year
Urban economy remained strong, despite large water savings under the state mandate.
Amidst drought and water cuts, farm GDP has also been growing
We learned some hard lessons…
Safe drinking water solutions are needed for rural residents

Small systems with contaminated wells and health violations

Reported dry wells

Salinas Basin

Tulare Basin
California’s aquatic ecosystems were unprepared for a warm, extended drought

- Building resilience requires:
  - Drought plans to prioritize supplies
  - Investments in refugia, conservation hatcheries
  - Environmental water budgets (and funds to buy water)

18 fishes at near-term risk of extinction

Anadromous fishes (9 species)
Resident fishes (9 species)
Funding, political will necessary to implement forest management plans
Groundwater should be managed as a drought reserve.
Continued efforts needed to build urban drought resilience

- Urban communities avoided major shortages, thanks to investments in supplies since early 1990s

- Even though major impacts were averted:
  - Local agencies should continue fostering regional approaches to managing supplies
  - More certainty needed on state, local roles in managing demand
  - Locals, state should address the fiscal fallout from conservation
California needs to strengthen water information, allocation, marketing systems

- Provide more accurate assessments:
  - How much water is there?
  - Who has claims to use it?
  - What is actually used?

- Fill accounting gaps, consolidate information, and make data useful
Thank you!
